

Section 2HW 4Answers for 4, 6, 9

$$\begin{aligned}
 (4) \quad y[n] &= x_c(t + nT - DT) \left[u(t + DT) - u(t - DT) \right] \Big|_{t = \frac{T}{5}} \\
 &= \begin{cases} x_c(t + nT - DT) & -DT \leq t \leq DT \\ 0 & \text{o.w} \end{cases} \Big|_{t = \frac{T}{5}} \\
 &= x_c\left(\frac{T}{5} + nT - DT\right)
 \end{aligned}$$

Conceptually, $y[n]$ can be obtained from $x[n]$ by reconstructing $x_c(t)$ from $x[n]$ and then by shifting $\left(DT - \frac{T}{5}\right)$ and resampling it with period T . However, this is not usually a practical approach because of the nonideal analog reconstruction filter, D/A converter, and A/D converter. Here, we obtain $y[n]$ using a FIR discrete time filter.

⑥ a) It is more appropriate to take

$$y[n] = x\left(t \pm \frac{7T}{13}\right) \bigg|_{t = \frac{nT}{3}} \quad \text{instead of}$$

$$y[n] = x\left(t \pm \frac{7}{13}\right) \bigg|_{t = \frac{nT}{3}}$$

b) $y[n] = x\left(t \pm \frac{7T}{13}\right) \bigg|_{t = n3T}$

⑨ If $G(e^{j\omega}) = H(e^{j\omega L}) \Rightarrow y_1[n] = y_2[n]$
